

ABSTRACT

[0037] A fluid quick connector includes first and second rotatably, non-axially movably engaged housings. A retainer is mountable in the second housing for lockingly coupling a fluid operative element to the second housing. The first housing has an annular recess at one end which receives a collar extending axially from the second housing. Projections extend radially from the collar and engage the recess in the first housing to rotatably interconnect the first and second housings.
